

## Signing in to the administrator account

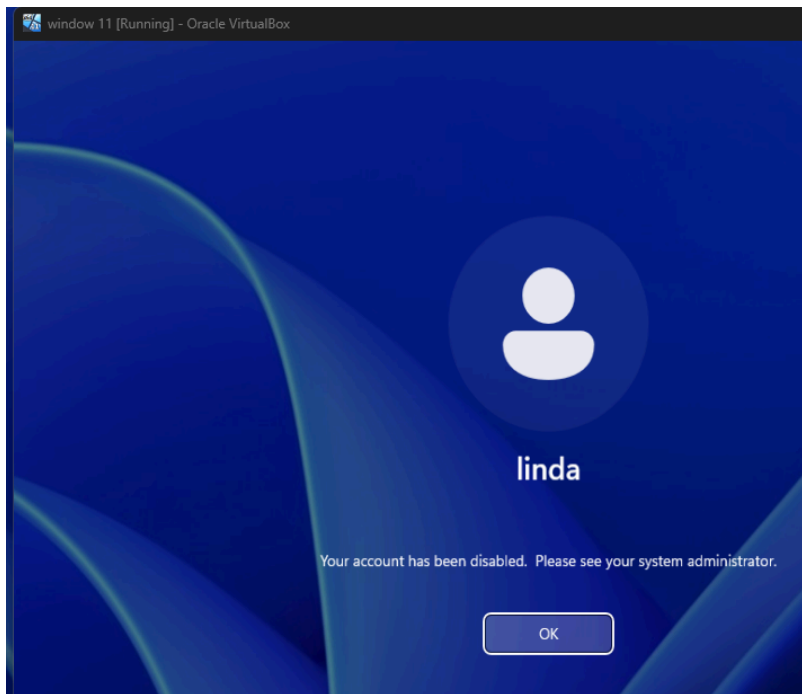

1. To delete a user account for offboarding reasons/ employee leaves job.
2. On file explorer— right click PC— properties—about— advanced system properties— under “user profiles” click setting and “delete” the user. (this will clean the user profile)
3. You must also disable account from the active directory
4. User “linda” should not be able to login again

The user account “Linda” should no longer be able to authenticate through the domain after being disabled in Active Directory.

During testing, I noticed the local user profile still remained on the Windows 11 machine even after disabling/deleting the domain account. I also encountered issues deleting the profile completely because Windows still recognized parts of the profile locally.

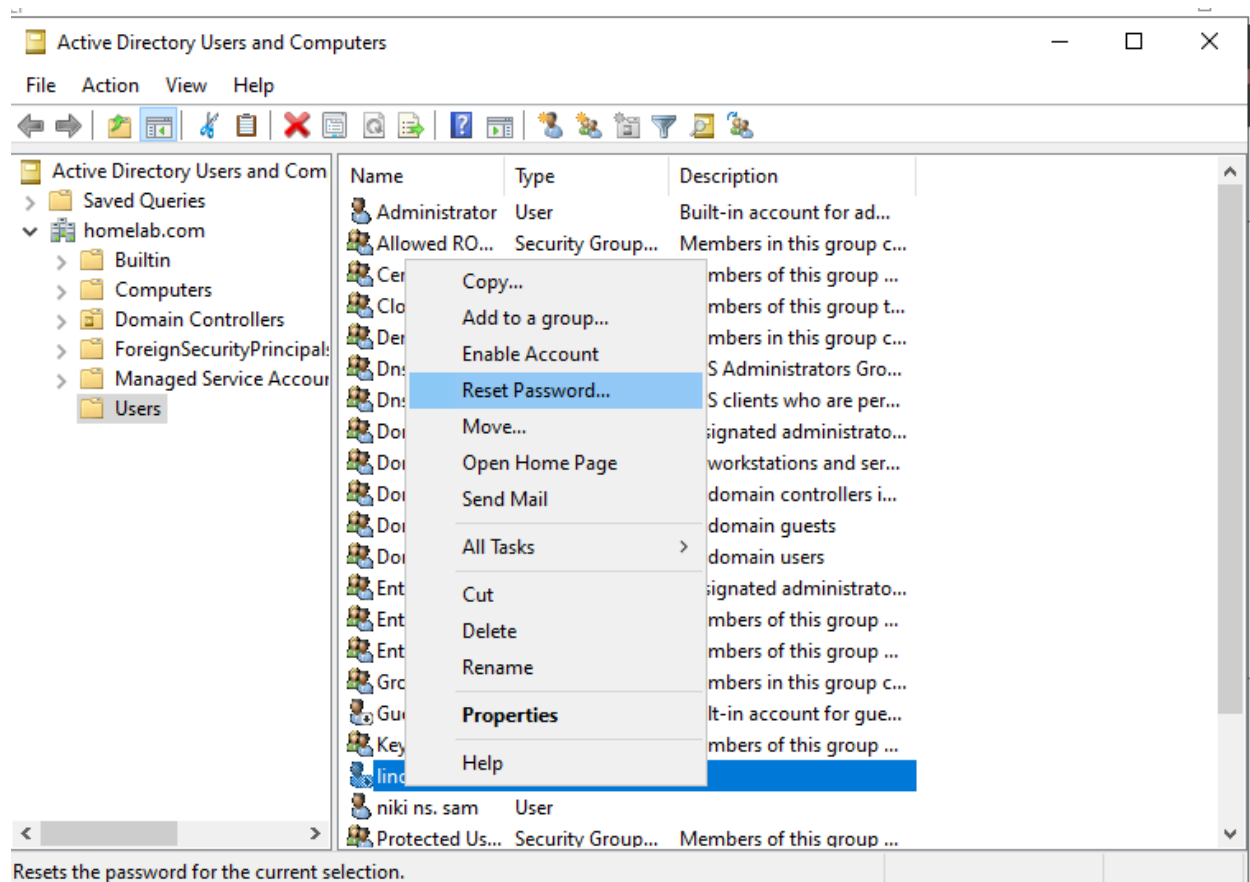

**To fix this** I had to restart the machine. Why this happened? is because the credentials are cached and stored the profile data .

## Offboarding User Accounts

1. From active directory users computers — right click on the user “linda” — properties— member of — remove “domain users”
2. Part of the removal process resetting password

While testing user offboarding, I attempted to remove the user from the “Domain Users” group but learned that Active Directory requires every domain account to have a primary group assigned.

## Group Policy overview

### Password age

Go to group policy management on active directoryPath:

Group Policy Management

→ Domains

→ homelab.com

→ Default Domain Policy

→ Edit

→ Computer Configuration

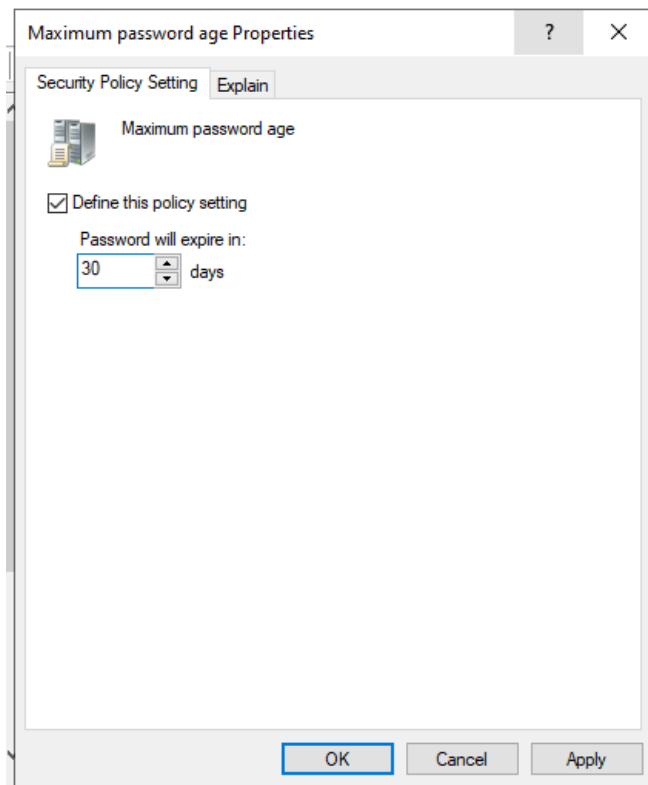

→ Policies

→ Windows Settings

→ Security Settings

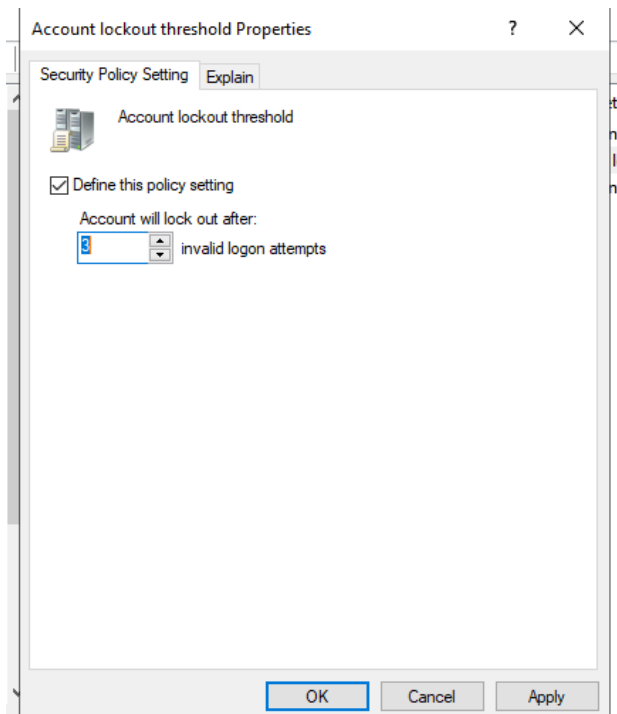

→ Account Policies

→ Password Policy — maximum password age set to 30 days

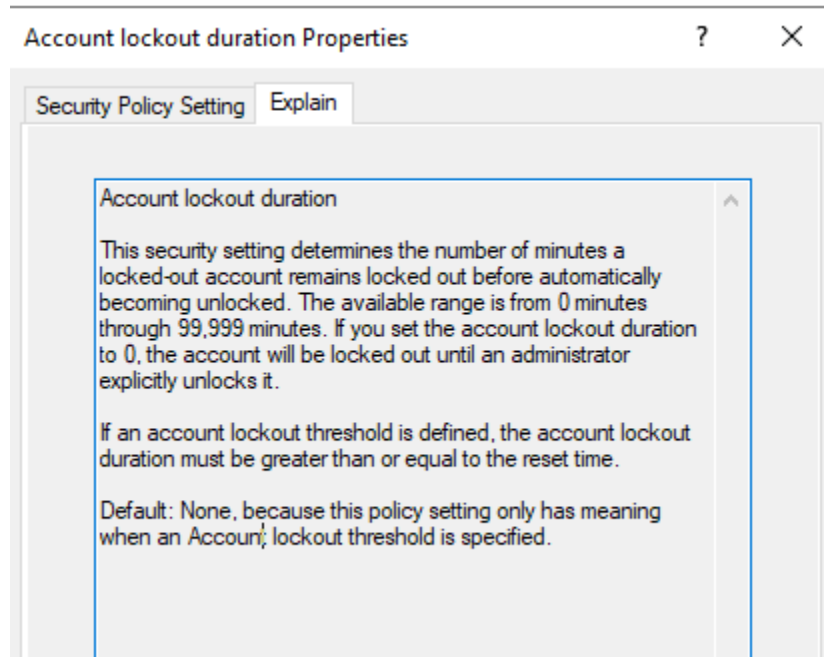

### For account lockout after several attempts

— account lockout — account lockout threshold properties

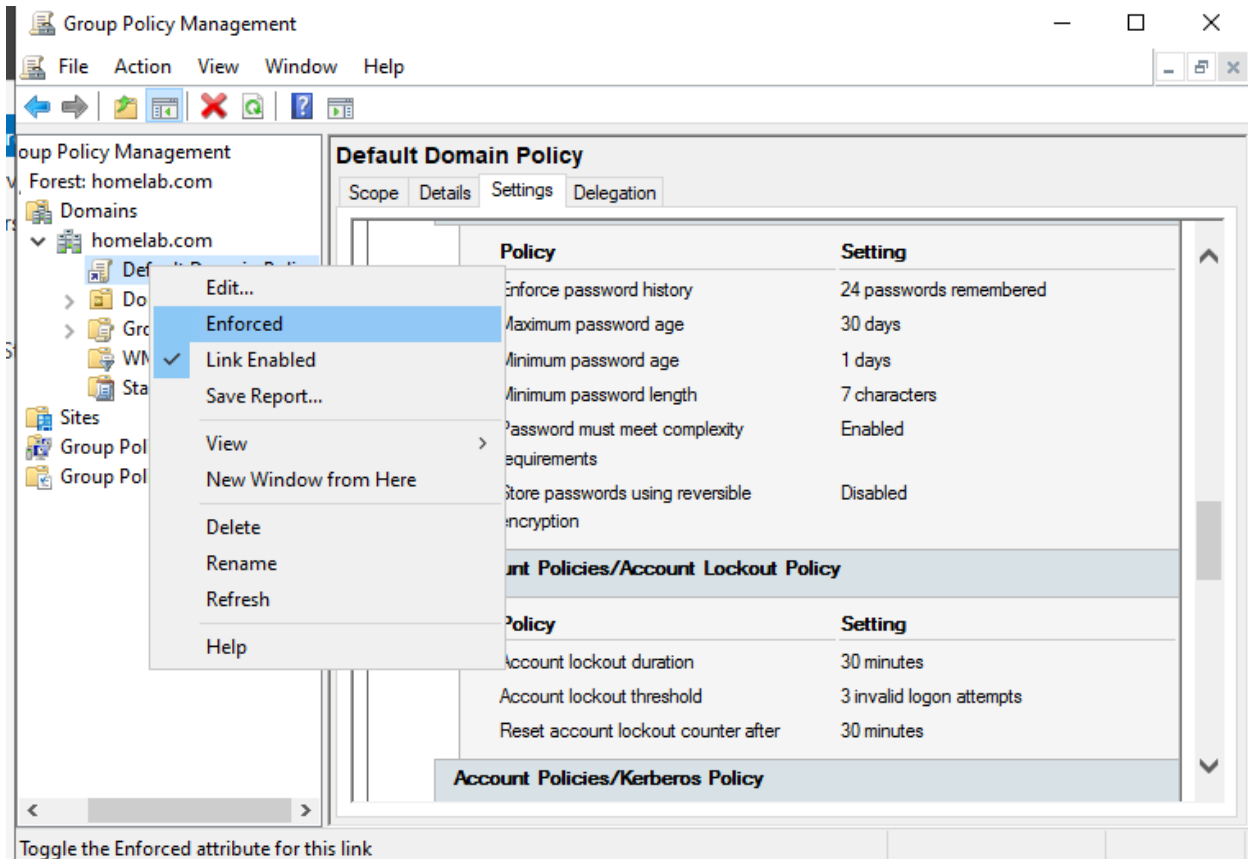

## Account lockout duration properties

Set to — **(360 minutes)** this is to prevent brute-force attack for security purposes.

**Make sure to enforce policy**

## Overview of the policy changes
